

ABSTRACT OF THE DISCLOSURE

An information reproducing apparatus includes a device operable to reproduce image signals recorded on a recording medium; a unit operable to set at least one image signal start point and end point for editing the recorded image signals; a storage device operable to store the image signal start points and end points thus set; and a controller operable to control the display of marks corresponding to the stored image signal start points and end points. The controller controls the display in such a manner as to display marks corresponding in number to the stored start and end points. The controller also controls the display so that the marks corresponding to the stored start and end points are displayed in a color different from the color of the marks corresponding to the start and end points not yet stored, and so that the marks corresponding to the start and end points already reproduced are displayed in a color different from the color of the marks corresponding to the start and end points not yet reproduced.
